Boolean Algebra and Quantum Physics with, Letters, Numbers and Alephine

By Mathios Skorakis (A Soviet Scientist in 1987)

I. See a Number-Letter Coded Mix

A,2, a, bcoede,do2ce….

Now articulate this to a axis – the axis here is a shifting axis.

II. Now make it divine

The complex pages of pages

This becomes in axis shifting in many ways, the process of a person drawing this on a board and making it a graph and deriving for you say parallelism in geometry.

The axis shifts then to Soviet people, who divine this as then a intersectional graph.

It comes from a historian’s paper coded by someone – now history is a sense of boats it will say and boat histories which then is articulated with intersectional graphs as boat- and ship construction and so many stories on then Greek it seems to be and us talking in Soviet manners.
